

Protocols, wallet providers, and platforms holding user funds deploy a SAFU powered pool for their own users, and a verified wallet drain pays out **automatically at a fixed multiple of the stake**.

BUILT FOR

Protocols

Protect the people using your contracts.

Wallet providers

Offer real cover inside your own wallet product.

Platforms holding user funds

Cover the accounts you already hold trust for.

THE PROBLEM

A drained wallet has no deterministic recovery path. When the Trust Wallet Chrome extension was breached on December 24, 2025, recovering funds meant proving identity and filing a police report, and that process ran close to two months. Security losses reached **\$972 million across 207 incidents** in the first half of 2026 while DeFi's total value locked fell 38 percent, so the risk held steady as the market around it shrank.

HOW IT WORKS

01

A business deploys a SAFU powered pool for its users.

02

Users stake assets into that shared pool.

03

SAFU's detection engine verifies a drain on chain.

04

The contract pays out at a fixed multiple of the stake, sized to the wallet's risk tier.

There is no vote and no claim form. The contract enforces the payout rule itself.

ALREADY RUNNING

- ✓ SAFUPoolV8 live on Ethereum mainnet, source verified and published.
- ✓ Soroban contract on Stellar testnet, 184 of 184 tests passing.
- ✓ Symbolically verified with Halmos, zero counterexamples.
- ✓ Deterministic by design, so replays match exactly.

WHITELABEL POOLS

The same contracts and detection engine deploy under a partner's own name. A protocol, wallet provider, or platform runs its own pool, seeds it alongside its users, and protects those users directly without building a coverage layer in house. Each partner pool runs the same verification and the same payout rule as the pool already live on Ethereum.

GRANT ASK

MILESTONE	AMOUNT
1. Whitelabel deployment package productized	\$60,000
2. First chain's grant-funded audit complete	\$35,000
3. First signed pilot partner live	\$45,000
4. Three total pools deployed	\$45,000
5. First case study published	\$15,000
Total	\$200,000

Engineering \$110K · coverage and outreach \$50K · infrastructure \$25K · audit \$15K. \$60,000 completes milestone 1, \$200,000 covers all five.

TEAM AND FUNDING

Two founders have been building SAFU since January 2026, based in Istanbul, Turkey, operating as MKD Global LLC. Funding to date is non-dilutive: **\$30,000** from the Stellar Community Fund under SCF #44, and a **\$2,000** Ethereum audit subsidy from Areta. No equity or token round has been raised.
